

Cybersecurity Consulting

Sugpiat CyberWerx understands the importance and complexity associated with meeting Cybersecurity requirements cost-effectively without compromising organizational business objectives, culture, people, processes, tools, and technology. Our consulting team places special focus on Cyber Resilience, Cyber Protection, and Cyber Risk Management. We understand the significance of ***threat protections*** from cyberattacks, the need for ***recoverability*** and impact reduction after cyberattacks, the importance of ***adaptability*** to continuously monitor for opportunities to reduce the likelihood of future attacks and data breaches, and the importance of exercised plans to identify evolving cyber threats and respond to them before organizational impact is realized. Our IT environment focuses on cyber resilience and ***durability*** since the consequences of a data breach can be technical, social, and financial in nature. It is imperative for every business to prioritize cyber resilience by integrating business operations with IT. Our experts specialize in a tailored implementation of the NIST Risk Management Framework, perform and award-winning risk assessments and analysis, and communicate findings in non-technical terms to enable cost-effective decision-making.

We tailor cybersecurity consulting and services to the needs of your mission to enable the most cost-effective strategy for data confidentiality, integrity, and availability.

We focus on proactive measures while implementing comprehensive monitoring and rapid response to cyber threats. Regardless of the platform or mission context, we can assist with your cybersecurity needs.
